

A mother runs into the emergency department with a toddler in her arms and tells the nurse that her child got into some of the child's clothes. After ensuring the airway is patent, what action should the nurse implement **first**?

- A Assess child for altered sensorium.
- B Determine type of chemical exposure.
- C Obtain equipment for gastric lavage.
- D Call poison control emergency number.

The nurse assumes care of a postoperative adult client with type 2 diabetes mellitus and learns that the client has a current blood glucose level of 750 mg/dL. When assessing the client, what is the **priority**?

- A Assess for signs of fluid volume deficit.
- B Observe wound drainage characteristics.
- C Measure the level of acute pain.
- D Determine when the client last ate.
